

Solution Document

Team-14

Introduction & Background

Solo travel offers personal growth, freedom, and discovery. However, it also presents a unique set of challenges, especially regarding safety. Women, in particular, express heightened vulnerability when travelling alone due to concerns about theft, harassment, scams, and unfamiliar environments. Despite an increasing number of travel apps in the market, user feedback reveals a significant gap between existing offerings and the real, lived safety concerns of solo travellers.

Through a two-phase user research approach consisting of surveys and in-depth interviews, this document identifies key user pain points and needs. These findings helped us in the creation of a comprehensive mobile application designed to serve as a safety-first digital companion for solo travellers.

Our goal is to answer the design challenge: **"How might we empower solo travellers, especially women, to feel more secure by providing tailored safety solutions?"**

Research Insights Summary

The user research phase yielded strong recurring themes that align closely with the use cases prioritized in this application.

Most Dominant Pain Points & Needs

- **Safety Anxiety:** Constant fear of theft, scams, and personal harm, especially when navigating unknown or dimly lit areas.
- **Distrust in Current Tools:** Existing apps are either too complex, lack transparency, or fail to provide verified, relevant data.
- **Fragmentation of Features:** Users expressed frustration about needing multiple apps for booking, navigation, reviews, and emergency support.

- **Desire for Human Validation:** Community-sourced feedback and recommendations were seen as significantly more trustworthy than algorithm-based suggestions.
- **Emergency Readiness:** A clear gap exists in accessible and immediate SOS features during moments of panic.

Phase 1: Survey-Based Insights

- **Demographics & Behavioural Patterns:** Predominantly female users aged 18–25 and 40+, with frequent domestic travel to urban regions.
- **Core Needs Identified:** Real-time alerts, intuitive UI, verified safety data, simplified communication tools, and emotionally reassuring feedback mechanisms.

Phase 2: In-Depth Interviews

- **Additional Depth:** Concerns about misleading reviews, inconsistency in alert preferences, lack of offline access, and skepticism toward AI-only features.
- **Emerging Trends:** A strong reliance on peer validation, growing acceptance of premium features if truly valuable, and interest in a single, unified safety platform.

Problem Statement and How It Connects to the HMW Statement

Problem:

Solo travellers, especially women, face persistent challenges related to safety, trust, and navigation. The current ecosystem of travel safety apps is fragmented, unverified, or too complex, leaving users overwhelmed and underprotected.

Our proposed solution tackles the HMW challenge—*"How might we empower solo travellers, especially women, to feel more secure by providing tailored safety solutions?"*—by delivering an all-in-one app that:

- Merges real-time navigation, safety alerts, and community insights.
- Offers verified, human-centric data.
- Operates effectively in both online and offline environments.

- Keeps the interface clear, approachable, and customizable.

Proposed Solution

Our app is a unified digital companion focused on safety-first design for solo travellers. It merges multiple essential functions—from trip planning and peer reviews to real-time navigation and emergency assistance—into one intuitive mobile app. Designed for ease of use and built on deep user insights, the app delivers a sense of security, connection, and confidence throughout a user's travel journey.

Following is the information architecture of our app- meaning how will the information flow within the app and how will the users can navigate within the app and its pages.

Our **Homepage (Dashboard)** acts as the **central hub**, from which users can branch out to:

Module	Purpose
Travel Planning	Book safer travel and accommodation, access verified info.
Explore/Search	Discover destinations with crowdsourced safety scores.
Safety Navigation	Real-time route tracking with hazard alerts.
Trusted Contacts	Share live location, auto-alert in emergencies.

Profile & Emergency Info	Setup personal info, access post-trip logs, manage subscriptions.
--------------------------	---

- Each of these features can be accessed independently and returns the user to the central hub, keeping the experience anchored and intuitive.

Use Cases Covered in Wireframe (To be Expanded in Storyboard)

1. Real-Time Navigation with Safety Alerts
2. Emergency Assistance and SOS Trigger
3. Post-Trip Feedback & Incident Reporting
4. Trusted Contacts with Live Sharing
5. Safe Travel & Accommodation Planning
6. Buddy System for Local Guidance & Group Travel Options

Each use case will be illustrated in the storyboard phase, along with some additional use cases as well.

Implementation Framework: Jobs-To-Be-Done (JTBD)

Job To Be Done	Pain	Gain	Solution
Plan a solo trip safely	Lack of verified data, scams	Confidence in bookings	Community-verified booking system
Navigate a new place	Unsafe areas, fear of getting lost	Real-time support	Safety Alerts + Route Guidance
Get emergency help	Delay in response, panic	Quick, reliable help	SOS Button, Auto-call, SMS backup
Choose safe places	Inconsistent reviews	Trustworthy info	Crowdsourced & verified reviews
Stay connected	Fear of being alone	Peace of mind	Trusted Contacts & Live Sharing
Share experiences	Help future travelers	Collective safety	Post-trip feedback, Ratings

Conclusion

The app emerges as a direct response to the real safety concerns voiced by solo travellers. Rooted in thorough user research and built with empathy, the app integrates the most vital features—navigation, emergency readiness, community insight, and trusted communication—into a unified digital safety companion. Its design not only addresses functional gaps in existing tools but also provides emotional reassurance through peer validation and a clear, user-first experience.

The selected use cases for the wireframe are carefully aligned with the most frequently cited pain points from our research. They are not just features—they are solutions. Real-time navigation with safety alerts mitigates the anxiety of getting lost or wandering into unsafe areas. Emergency SOS triggers and live sharing ensure rapid response in moments of distress. Post-trip feedback builds a cycle of trust, while safe planning and buddy systems empower users to make informed, confident decisions. Each use case is essential to delivering on our core mission: **making solo travel safer, more connected, and more empowering for everyone—especially women.**
